

		increasing.
3.	B	Note that the carriages and the engine have a common acceleration, say a. Let the mass of each carriage be m. Consider both carriages, Newton's 2nd law gives $T = (2m)a$, so $a = \frac{T}{2m}$ Consider the back carriage. Tension pulling the back carriage is then $ma = m \left(\frac{T}{2m} \right) = \frac{T}{2}$
4.	D	During acceleration $W = mg = ma$, so $W = m(9.81 + 2.0)$
