

		$\frac{30}{W} = \frac{9.81 + 2.0}{9.81 + 2.0} = 0.661$
5.	A	Since the same load is applied, for X, if extension is L, then extension for Y will be $2L$ For Z, the extension will be the greatest as the top two springs will stretch by the same amount of L while the lower spring will have twice the extension due to the weight being supported by only one spring
6	C	$\text{Work done} = 120 \cos 37^\circ \times 5.0 = 470 = 480 \text{ W}$
