

In terms of percentage,

$$= 0.125 \times 100\% = 12.5 \%$$

14 Ans: C

Since heat supplied $Q = ML + \text{Heat loss to environment}$, $M = \text{mass vaporized/loss}$

Power supplied $P = \mathbf{m}L + h$ where $m = \mathbf{rate}$ of loss of mass of liquid,

$h = \mathbf{rate}$ of heat loss to environment

Substituting, $P_1 = m_1 L + h$ eqn (1), $P_2 = m_2 L + h$ eqn (2)

$$(1) - (2) \text{ gives } L = \frac{P_1 - P_2}{m_1 - m_2}$$

15 Ans: B
