

$$\Phi = 3.1 \times 10^{-19} \text{ J}$$

- 29 C** Total BE before reaction = $7.59 (235) = 1783.65 \text{ MeV}$
Total BE after reaction = $(8.26 \times 121) + (8.52 \times 113) = 1962 \text{ MeV}$
Change in BE = $+179 \text{ MeV}$, manifested as the energy released (products are more stable)
