

9. **Ans: B**

Heat was removed from it at a constant rate when it was totally liquid, and when totally solid.

$$mc_{liquid} \left(\frac{\Delta T}{t} \right)_{liquid} = mc_{solid} \left(\frac{\Delta T}{t} \right)_{solid}$$

$$c_{liquid} \left(\frac{400 - 300}{100} \right)_{liquid} = c_{solid} \left(\frac{300 - 200}{50} \right)_{solid}$$

$$c_{liquid} = 2c_{solid}$$

10. **Ans: B**
