

		$\lambda = 4.78 \times 10^{-7} \text{ m} = 478 \text{ nm}$
17	C	Assuming that the rate of heat loss is constant, a longer time interval Q compared to time interval S means that more thermal energy is given out during the process of condensation than freezing. For the same mass, more thermal energy implies that the specific latent heat of vaporisation is greater than its specific latent heat of fusion.

4

18	D	With the reduction in the volume of gas, the distance between the walls of the
