

27	A	By Fleming's Right Hand Rule, the induced current will flow from Y to X inside the rod, which makes X the end with higher potential. Using $\mathcal{E} = BLv$, we have $\mathcal{E} = 3.5 \times 0.80 \times 2.0 = 5.6 \text{ V}$ Thus, $P = \mathcal{E}^2 \div R = 5.6^2 / 6 = 5.23 \text{ W}$
28	C	Half-wave rectification is achieved with one diode.
