

- 23** When a small cylindrical magnet is released from rest above a copper pipe, the magnet falls slowly through the pipe.

What change can be made so that the magnet falls slower through the same length of the pipe?

- A** Place the magnet nearer to the top of the pipe before releasing it from rest.
- B** Use a pipe of material with higher resistivity.
- C** Use a weaker magnet of the same mass.
- D** Use a lighter magnet.

24 An alternating current flowing through a resistor varies with time as shown
