14 Monochromatic light is incident normally on a single slit. The resulting diffraction pattern is observed on a screen. The width of the central maximum of the diffraction pattern is x.

The distance between the single slit and the screen is much greater than the slit width and is unchanged.

The light source is replaced by another light source of light with twice the wavelength, and the single slit is replaced by one that has half the slit width.

What is the linear width of the new central maximum in terms of x?

A $0.5x$

B x

C $2x$

D $4x$
