1 Which of the following statements is correct?

A In the measurement of the diameter of a sphere, taking more readings and finding the average value of these readings will help to reduce the fractional uncertainty of the diameter.

B Plotting a graph of voltage and current readings for an ohmic device and using its gradient to find resistance will help to eliminate random error.

C Measuring the timing for a large number of oscillations will help to reduce the fractional uncertainty of the period.

D Checking for zero error on a voltmeter before measuring a voltage will help to reduce random error.
