4 Two blocks of identical size, one made of wood and the other of copper, are at rest on the ground as shown in (1) and (2). Both blocks are then accelerated upwards by an applied force *F* as shown in (3).

Which of the following statements is correct?

A The force by ground on the copper block in (1) is greater than the force by the ground on the wooden block in (2) because the copper block is denser than the wooden block and exerts a bigger force on the ground.

B The force by the wooden block on the copper block in (1) is the same as that by the copper block on the wooden block in (2) due to Newton's Third Law.

C The force by the copper block on the wooden block in (3) is equal to that by the copper block on the wooden block in (2).

D The applied force *F* on the wooden block in (3) is greater than the force by the ground on the copper block in (1).
