29 A sample of a radioactive isotope with nucleon number 210 decays by alpha emission into a stable isotope with nucleon number 206. The process has a half-life of 140 days.
If all the emitted alpha-particles escape from the sample but none of the daughter product escapes, what will be the percentage decrease in the mass of the source after 280 days?

A 0.48% **B** 1.43% **C** 25% **D** 75%
