

- 18** A tiny charged mass Q is suspended at rest by the electric field between two horizontal, charged metallic plates as shown. The lower plate has a positive charge and the upper plate has a negative charge.

Which statement is true?

- A** Q is negatively charged.
- B** If some electrons are removed from Q , it will accelerate upwards.
- C** If the perpendicular distance between the two plates is increased, Q will accelerate upwards.
- D** Decreasing the potential difference between the plates will cause Q to accelerate upwards.

- 19** The electric potentials V are measured at distances x from P along a line PQ .
