

		Hence, the current in 50 Ω resistor is 0.25 A.
23	B	The magnetic force provides the centripetal force necessary for the charge to move in a circle. $Bqv = \frac{mv^2}{r}$ $r = \frac{mv}{Bq}$ For choices A, B, C and D, the radius is $\frac{6mv}{Be}$, $\frac{3mv}{Be}$, $\frac{6mv}{Be}$ and $\frac{16mv}{Bq}$ respectively.
