

		$\approx 1.8 \text{ V}$
25	C	Effective horizontal length of the metal wire cutting the magnetic field = $2r$ Using $E = BLv$ $E = B \times 2r \times v$ $= 2Brv$ By Lenz' Law, the induced current in MN will give rise to a vertically upward force on the wire, opposing the wire falling. By Fleming's left hand rule, the induced current in MN will flow from M towards N. Hence, N will be at the higher potential.
26	D	Peak voltage in secondary coil is 60 V
