

8	D	At different positions along the vertical circular ramp, the normal contact force on the ball will be different. As such, the direction of resultant force and hence acceleration of the ball will not always directed towards the centre of the ramp, resulting a change in the speed.
9	A	At the top of the ramp, the normal contact force on the ball will be different. As such, the direction of resultant force and hence acceleration of the ball will not always directed towards the centre of the ramp, resulting a change in the speed.
