

- 24** In a cylindrical ion guide, six conducting rods are equally spaced along the circular surface as shown below. Currents in conducting rods 1, 3, and 5 are directed out-of-page, and the currents in conducting rods 2, 4 and 6 are into the page. All currents have the same magnitude. Positive ions are travelling along the central axis of the cylinder.

Due to a fault, a larger current now flows in conducting rods 6. Which direction will the positive ions be deflected?

- | | |
|------------------------|------------------------|
| A Towards rod 1 | B Towards rod 3 |
| C Towards rod 4 | D Towards rod 6 |
