

- 30** Antimony-124 undergoes radioactive decay, with a half-life of 60 days, to become tellurium-124. Tellurium-124 is stable.

Initially, a sample of antimony-124 contains no tellurium.

For this sample, after what period of time will the ratio of antimony-124 to tellurium-124 be $\frac{1}{2}$?

- A** between 30 days and 60 days
- B** 60 days
- C** between 60 days and 120 days
- D** 120 days
