

	hence, the speed at point D will be greatest.
4	A Both stones have the same initial horizontal velocity and hence same final horizontal velocity. In the vertical component, both stones experience the same change in displacement (s). Using $v^2 = u^2 + 2as$, the same final vertical velocity will be obtained. Also, using COE, it can also be derived that the speeds in both cases will be the same.
5	D
