

- 14 In the figure below, graph **C** shows how the pressure of a fixed mass of an ideal gas varies with its volume at a constant temperature.

If a similar ideal gas with double the mass is used and the experiment is conducted at the original constant temperature, which curve (**A**, **B**, **C** or **D**) gives the variation of the gas pressure with its volume?

Answer: B

$$pV = nRT$$

When mass is doubled for the same gas, n is doubled.

At the same T , product pV remains constant, but is doubled for the 2nd gas.

→ For the same V , p is doubled.

15	An ideal gas undergoes a cyclic process in three stages:
