

mean speed = $(2u + 3u + 10u + 11u + 15u) / 5 = 8.6u$

16 Latent heat of vaporisation is the energy required to

- A** separate the molecules of the liquid
- B** separate the molecules and to push back the atmosphere
- C** increase the average molecular speed in the liquid state compared to that in gaseous state
- D** separate the molecules and to increase the average molecular speed in the liquid state compared to that in gaseous state.

Ans: B

As the potential energy of the liquid is increased for substance to change from liquid to gases, the volume has to increase and this energy will also include work done to push back the atmosphere.
