

	Power detected by microphone = $I \times \text{Mic Area} = (0.2487)(0.85 \times 10^{-4}) = 2.11 \times 10^{-5} \text{ W}$
13.	Ans: B For observable interference to occur, 1. The sources must be coherent. 2. The amplitudes of the individual wave should be approximately of the same amplitude. 3. The waves can be either unpolarised or polarized in the same plane if transverse waves are used.
14.	Ans: D $d \sin \theta = n \lambda$
