

	$B(1.6)(0.20)(0.25) = (0.020)(9.81)(0.30)$ $B = 0.74 \text{ T}$
26.	Ans: C Since the South pole is dropped from a higher height, it will enter the coil with a greater speed. This means a greater rate of change in the flux linkage and hence the maximum induced current will be larger. Since the pole is now opposite to the first case, the direction of the induced emf (hence induced current) will also be opposite.
27.	Ans: B
