

	of the induced emf (hence induced current) will also be opposite.
27.	Ans: B When the second coil of $2N$ turns is used, the peak e.m.f. induced will be twice due to a larger rate of change of flux <u>linkage</u>. However, the induced current will remain the same as the resistance of the coil is also twice as large due to the doubling of the length of wire used to manufacture the coil. Hence B is an incorrect statement.
28.	Ans: D
