

So y-axis is temperature in $^{\circ}\text{C}$ and x-axis is volume in m^3 .

13. Ans: A

Since there is no change in temperature during the melting process, the sum of the randomly distributed KE remains unchanged.

The heat supplied to melt the ice results in the increase in the intermolecular PE by $3.34 \times 10^5 \text{ J}$.

14. Ans: D
