

24	A	Current in the adjacent loops of the spring are parallel giving rise to attractive magnetic force between adjacent loops; spring is compressed.
25	B	When the speed of the electron is halved, the magnitude of the upwards electric force remain unchanged while the magnitude of the downwards magnetic force is halved. Hence the resultant force is now acting upwards, deflecting the electrons upwards.
26	A	With the alternating current flowing vertically, the magnetic field acting in the coil is acting into and out of the paper. Hence the plane of the coil should be arranged in the
