

		remain unchanged while the magnitude of the downwards magnetic force is halved. Hence the resultant force is now acting upwards, deflecting the electrons upwards.
26	A	With the alternating current flowing vertically, the magnetic field acting in the coil is acting into and out of the paper. Hence the plane of the coil should be arranged in the plane of the paper to experience the change in magnetic flux linkage. In addition, the magnetic flux density due to a straight wire is inversely proportional to the distance from the wire. Hence the coil should be placed closer to the wire to experience the greater magnetic flux density and hence change in magnetic flux linkage.
27	D	The I_{rms} of the square waveform is I_o .
