

		KE increases linearly with displacement at first (vs $\sqrt{E}$), then decreases at greater and greater rate due to increasing EPE.
8	A	Power supplied, $P = \frac{mgh}{t} = mgv$ Since the height is constant for the first 8 seconds, vertical speed is zero power supplied will be zero for the period. Vertical speed is constant for the next 7 seconds and becomes zero for the next 5 seconds, power supplied will be of a constant value for that period.
