

Answer: D

18 Since current is the rate of flow of charge at a point,

$$I = \frac{dQ}{dt} = \frac{1.6 \times 10^{-19}}{0.5(2.0 \times 10^{-10})} = 1.6 \times 10^{-9} \text{ A}$$

Answer: D

5

19 The given circuit is similar to the circuit below
