

	There is still gravitational force acting on it which causes it to move in circular motion.
12	Answer: C Since gravitational potential energy of satellite becomes less negative, there is an increase in potential energy and the satellite is moved further from the Earth. $\text{Increase in gravitational potential} = \frac{-1600 - (-4800)}{80}$ $= 40 \text{ MJ kg}^{-1}$
13	Answer: D
