

$$C_{rms1} = \sqrt{P_2 V_2} = \sqrt{1(1)}$$

- 12 D** If the gases are ideal $PV = nRT = nR(\theta + 273)$
 So the graph of PV vs θ has a positive gradient (nR where $n = 1$), a y-intercept ($273nR$) and cuts the x scale at -273 (set $PV = 0$).
