

	$F = 10\text{ N}$	
6	B Due to smaller weight, a smaller air resistance is needed by the foam ball to achieve zero net force to reach terminal velocity. Hence time required to reach terminal velocity is shorter. So option A and C are eliminated. In addition, since air resistance depends on	D

2

	speed, a smaller air resistance will require a smaller terminal velocity. Hence option D is eliminated.	
3	C	A
