

13**Answer: A**

$$P_{\text{supplied}} = \frac{m}{t} l_f + h_{\text{rate of heat loss}}$$

$$P = \frac{m}{t} l_f + h_{\text{rate of heat loss}}$$

$$650 = \frac{(3.0)}{2.0 \times 60} l_f + h_{\text{rate of heat loss}}$$

$$1200 = \frac{(3.0)}{1.0 \times 60} l_f + h_{\text{rate of heat loss}}$$

$$1200 - 650 = \left[\frac{(3.0)}{1.0 \times 60} - \frac{(3.0)}{2.0 \times 60} \right] l_f$$

$$l_f = 22 \text{ kJ kg}^{-1}$$

14**Answer: D**
