

19	Answer: B
	$\sin \theta = \frac{\lambda}{2b} = \frac{1}{2} \quad \sin \theta \approx \frac{1}{2} \theta \quad \text{if angles are small}$ b is doubled, double of the wave energy is allowed to pass through the slit. Since double of the energy is now spread over half the area, the maximum intensity is increased to 4 times.

20	Answer: D
----	-----------
