

17	C	P is travelling towards left and Q is travelling towards right. Let their amplitudes be A. Given that at $t = 0$, P has a negative cosine profile and Q has a positive cosine profile, hence, the resulting stationary wave would produce zero amplitude, Y. $T/4$ later, both P and Q have a negative sine profile, the resultant amplitude would correspond to Z. $T/2$ later, the resultant amplitude would be zero. $3T/4$ later, the resultant amplitude would correspond to X. Hence, the correct answer is Y Z Y X.
18	B	Reading from the graph, a distance on the screen of 1.10 mm corresponds to a phase
