

		Option D is about potential difference not potential gradient.
20	D	The acceleration on the electron is constant under the influence of the uniform E-field. Applying equations of motion for uniform acceleration in Kinematics: $v^2 = u^2 + 2as, \quad u = 0$ $v = \sqrt{2as}$ $v \propto \sqrt{s}$ The graph in D correctly depicts this relationship.
21	C	Charge $Q = \text{Area under } I-t \text{ graph} = \frac{1}{2}(0.5)(1+2)(60 \times 60) = 2700 \text{ C}$
