

26	B	The magnetic flux (Φ) through the transformer is the same for both primary and secondary coils. By Faraday's Law, the average induced emf in the secondary coil = change of flux linkage/ time $ \mathcal{E} = \frac{\Delta\Phi}{\Delta t} = \frac{N\Delta\phi}{\Delta t} = \left \frac{(50)(0.00 - 0.54)}{0.18} \right = 150 \text{ V}$
