

		Therefore, maximum displacement is at Z.
4	B	The acceleration is downwards, thus resultant force is downwards. The magnitude of the force exerted on the block by the floor (upwards) is always less than the magnitude of the weight of the block (downwards). If the block is placed on a weighing scale in the lift, the scale will read a value less than its original weight.
5	C	The weights Mg and Mg provide the tension forces, balancing the weight of the object in
