

- 18 W, X, Y and Z are four points on a square as shown.

A point charge $+Q$ is fixed at W. Another point charge $-Q$ is moved from X to Y.

Which of the following statements is true?

- A The electric potential at Z will increase.
- B The electric potential energy of the system will decrease.
- C The attractive force between the two charges will increase.
- D The magnitude of the electric field strength at Z will increase.

18	D	A: When a negative charge is moved from X to Y, the negative charge will contribute a more negative potential, so electric potential will drop B: The unlike charges are attractive. By placing them further apart, work needs to be done on the system, thereby increasing the potential energy of the system C: Distance increases so attractive force will decrease. D: Original After
