

		Heat loss = 48 440 J. So rate of heat loss = $\frac{48440}{120} = 404 = 400 \text{ W}$
11	C	density of the gas $\frac{6.80 \times 10^{15}}{1 \times 10^{-6}} \times \frac{2.02 \times 10^{-3}}{6.02 \times 10^{23}} = 2.282 \times 10^{-5} \text{ kg m}^{-3}$ pressure $p = \frac{1}{3} \times 2.282 \times 10^{-5} \times 1900^2 = 27.456 \text{ Pa}$
12	C	equating pV at 40 m deep and at the surface, we get
