

		So $V = \left(\frac{4.709+1.0}{1.0} \right) \left(\frac{293.15}{277.15} \right) \times 20 \text{ cm}^3 = 120.8 = 120 \text{ cm}^3$
13	B	$a = g - r\omega^2$ Since g can also be expressed as $g = \frac{Gm}{r^2} = \frac{G}{r^2} \rho \left(\frac{4}{3} \pi r^3 \right) = \frac{4}{3} G \rho \pi r$ The values of a at the equator and the pole will increase when r increases.
14	A	GMm
