

		lower potential at Q (lower negative potential value).
21	A	Using $I = Ne/t$ Number of particles travelling in one second $= I/e = 10 \times 10^{-6} / 1.6 \times 10^{-19} = 6.25 \times 10^{13}$ Since the particles travel 2.5×10^7 m in one second, The number of particles in one centimetre length $= 6.25 \times 10^{13} / 2.5 \times 10^9$ $= 25000$
22	A	Algebraic sum of potential due to charges at A and B is zero, so
