

There would be no resultant force on either ring.

24 Ans: D

When current runs through the solenoid, magnetic poles are set up on the solenoid and by Lenz's Law, magnetic poles will also be set up on the Aluminum ring to oppose the poles due to solenoid.

When current in solenoid starts to decrease, by Lenz's Law, current in aluminium ring will change direction and results in attraction between ring and solenoid.

Hence, the forces acting on the ring will alternate periodically.

25 Ans: B
