

correct.

13 B

$$10 = \frac{mc\Delta\theta}{t} + h \quad (1) \text{ where } h \text{ is rate of heat loss to surroundings}$$

$$18 = \frac{3mc\Delta\theta}{t} + h \quad (2) \text{ Solving (1) and (2) gives } h = 6.0 \text{ W}$$

14 B

At constant P, $V \propto T$. When cooled, T decreases, so V decreases. Since gas
