

- 25 C Similar to Faraday's homopolar generator. The induced current $I = \varepsilon / R = B\pi r^2 f / R$, which is **a constant value** when r and f are kept constant. However the direction of current changes clockwise or anticlockwise, depending on which radii is cutting the flux (use Fleming RH rule).

- 26 C de Broglie wavelength $\lambda = h/mv$ so $\lambda \propto 1/m$ for same speed v .
