

Ans: C

Q3

Area under v - t graph is the displacement.

For graph P, the area is always positive, meaning that there is positive displacement.

For graph Q, the area during the negative velocities and the area during positive velocities are equal. Hence the total displacement is zero.

Displacements for graphs P and Q are thus different.

The magnitudes of the total area under the graphs P and Q are *different*. Thus the total distances travelled for P and Q is *different*.

Ans: A
