

5	B	The bar is in equilibrium and the load (weight = W) is a constant. The position of the pivot is also fixed. Let it be a distance h away from the fixed load. Taking moments about the pivot, $Wh = Fx$ Wh is a constant since W and h are constants. Hence, $Fx = \text{constant}$ $F \propto 1/x$ Graph B shows this relationship.

6	C	A body in equilibrium and acted on by three forces (P , M and tension in the thread)
