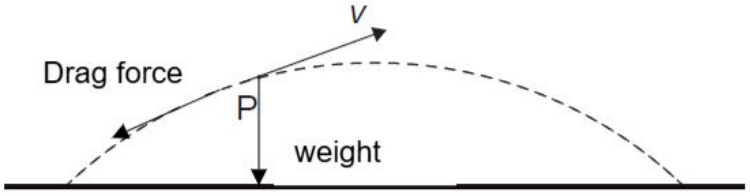
At the highest point, kinetic energy $= \frac{1}{2}mv_x^2 = \frac{1}{2} \times 0.15 \times 12^2 = 10.8$ J

**10** B



Resolving the drag force horizontally and vertically, there is a horizontal component of the drag force, as well as a net downward force ( weight + vertical downward component of drag ) acting on the ball.

Hence, the horizontal acceleration will be non-zero, and the vertical acceleration will be greater than 9.8 m $s^{-2}$.

**11** C
