greater than 9.8 m s^{-2}.

11 C

The force acts in the direction perpendicular to the side of table since the component of the momentum of the ball parallel to the side of table did not change.

$$\text{Average force on ball} = \frac{\Delta \underset{\sim}{p}}{\Delta t} = \frac{m\underset{\sim}{v}_f - m\underset{\sim}{v}_i}{\Delta t} = \frac{m(v\cos 30^\circ) - m(-v\cos 30^\circ)}{\Delta t} = \frac{2mv\cos 30^\circ}{\Delta t}$$
