26	**C**	
27	**B**	For a straight current-carrying wire in a magnetic field, $$F = BIL\sin\theta$$ Here, $$B = 0.40\ \text{T}, I = 5.0\ \text{A}, L = 0.12\ \text{m}$$ $$F = (0.40)(5.0)(0.12)\sin 45^\circ$$ $$F = 0.17\ \text{N}$$ Using Fleming's left-hand rule, the current is from Y to Z, downwards and to the right, while the magnetic field is to the right. The force is therefore out of the page.
